

Every AI decision should know the terms of its data.

Wolfe's executive challenge is to turn data trust from an implicit expert judgment into a measurable, self-service platform behavior.

Role objective

Make core data trustworthy, systematize new-source onboarding, and enable AI teams to identify reliable sources without recurring platform-team escalation.

WHY THIS ROLE MATTERS NOW

Wolfe operates across merchant programs, platform APIs, on-demand fulfillment, card-linked gifting, consumer brands, fraud, support, and AI. Public signals show continued product and merchant expansion alongside explicit AI and infrastructure leadership hiring. The resulting platform problem is not simply volume; it is the combination of more sources, more product contexts, more decisions, and higher consequences.

COMPANY MOMENT

PUBLIC SIGNAL	PLATFORM IMPLICATION
Portfolio of merchant, platform, business, and consumer gifting solutions	Shared standards must span multiple business models without erasing domain context.
Card issuance, distribution, fulfillment, settlement, fraud, and customer-service obligations	Data quality, lineage, semantic meaning, security, and operational service levels directly affect customer and merchant trust.
Named SVP of Artificial Intelligence plus executive infrastructure hiring	AI capability is being institutionalized; the data and platform layer must become a reliable internal product.
Founder-led growth and five-day Pittsburgh onsite expectation	The leader must make decisions quickly, align in person, and build accountable mechanisms rather than committee-heavy governance.

OPERATING TENSIONS

TENSION	LEADERSHIP STANCE
Founder urgency vs. production-grade trust	Define a small non-negotiable trust contract and automate it into platform defaults.
Enterprise standard vs. product autonomy	Standardize the contract; let domains own context, semantics, and operating decisions.
Semantic flexibility vs. decision consistency	Publish meaning, examples, exceptions, and versioning where teams discover data.
Central platform authority vs. distributed source ownership	Platform owns minimums and observability; source owners own quality and remediation.

Data Use Card

A MEASURABLE CONTRACT FOR AI-READY DATA

Russell Dudek · Candidate for VP, Data Platform & Knowledge

DISTINCTIVE THESIS

Data trust should be issued, not inferred.

A priority dataset should not enter AI use until its identity, quality, meaning, freshness, ownership, approved uses, restrictions, and issue-service expectations are legible to people and machines.

THE OPERATING MECHANISM

BEHAVIOR	REQUIRED OUTPUT	DECISION MADE EASIER
Identify	Source, domain, owner, authoritative fields, consumers, critical decisions	What is this dataset, and who is accountable?
Qualify	Quality score, freshness, lineage, semantic clarity, privacy/security, fitness	Can this use case rely on it?
Publish	Discoverable terms, approved uses, restrictions, examples, machine-readable metadata	Can a team choose it without escalation?
Service	Detection, escalation, owner, SLA, remediation, deprecation behavior	What happens when it fails?
Learn	Usage, questions, exceptions, model outcomes, rework, version changes	Should the standard expand, change, or retire?

DECISION RIGHTS

Platform leadership decides

Minimum metadata and quality contract; architecture standards; prioritization; observability; source onboarding requirements; exception and deprecation policy.

Domain owners decide

Authoritative meaning; acceptable use; business thresholds; remediation ownership; human authority; product-specific consequences.

BALANCED SCORECARD

DIMENSION	PRIMARY MEASURE	LEADING SIGNAL
Trust coverage	% priority datasets rated and documented	Owner and contract completeness
Service reliability	Detection-to-remediation time	Issue age and escalation clarity
Onboarding speed	Scope-to-production cycle time	Reusable steps and regression rate
Self-service	Ad hoc questions escalated to platform team	Successful discovery and source selection
AI outcome quality	Use-case-specific error, abstention, rework, and adoption	Terms coverage and exception learning

CHANGE BURDEN

Source owners must maintain meaning, quality, and service obligations; AI teams must select data through published terms rather than tribal knowledge; engineering must expose lineage, incidents, and quality telemetry; executives must support explicit holds when the evidence is insufficient. Adoption is not a communications plan - it is the new default way work enters the platform.

Proof and Discovery

EVIDENCE, ENTRY LOGIC, AND EXECUTIVE QUESTIONS

Russell Dudek · 412.287.8640 · russelldudek@gmail.com

— VERIFIED EVIDENCE MAP

Vape-Jet	Current cross-system operating transformation across ERP, CRM, Jira, Slack, telemetry, quality, support, production, purchasing, engineering issue flow, and approximately 1,000 fielded robots.
DudeWorth	AI readiness, structured context, retrieval, agents, evaluation, human judgment, escalation, governance, adoption, and measurable operating outcomes.
Compunetics	Engineering/manufacturing/quality leadership, high-reliability programs, process control, root cause, standard work, technical communication, and consequence-aware customer delivery.
Amazon	Launch, 24/7 operating cadence, visibility, escalation, standard work, Gemba, and scaled customer-backward mechanisms supporting approximately five million second-day orders annually.

— IMMEDIATE CONTRIBUTION

First contribution

Create the baseline: decision-critical use cases, priority datasets, source owners, current quality measures, semantic friction, issue SLA performance, and escalated-question volume.

First proof

Use one net-new source and two active AI teams to test the Data Use Card, onboarding playbook, self-service experience, and issue-service mechanism.

— EXECUTIVE QUESTIONS

- 01 Which active AI use cases are blocked by access, and which are blocked by uncertainty about meaning, quality, freshness, or authority?
- 02 How will Wolfe define the priority dataset portfolio behind the 90% target?
- 03 Where does semantic disagreement create the most rework today?
- 04 Which architecture decisions are already committed, and which are expected from this role?
- 05 What behavior would prove governance is operating by default rather than by committee?
- 06 What is the current baseline for ad hoc data escalations, and what would true self-sufficiency look like?
- 07 What must this leader stop, hold, or deprecate when the trust contract is not met?
- 08 Which team capabilities exist today, and where must the VP recruit, coach, or reorganize?
